Hemoglobin A1c Calibrator Set

Intended Use
This product is for the purpose of calibrating results in the quantitative determination of human hemoglobin A1c (HbA1c) in blood by automated immunoassay. For in vitro diagnostic use only.

Summary
Throughout the circulatory life of the red cell, Hemoglobin A1c is formed continuously by the addition of glucose to the N-terminal of the hemoglobin beta chain. This process, which is non-enzymatic, reflects the average exposure of hemoglobin to glucose over an extended period. In a classical study, Trivelli et al. showed Hemoglobin A1c in diabetic subjects to be elevated 2-3 fold over the levels found in normal individuals. Several investigators have recommended that Hemoglobin A1c serve as an indicator of metabolic control of the diabetic, since Hemoglobin A1c levels approach normal values for diabetics in metabolic control. Hemoglobin A1c calibrators are produced from lyophilized human hemolysate prepared from packed human erythrocytes. Stabilizers are added to maintain hemoglobin in the reduced state for the accurate calibration of the hemoglobin A1c procedure. The lyophilized hemoglobin A1c calibrators are a hemolysate prepared from packed human erythrocytes. Stabilizers are added to maintain hemoglobin in the reduced state for the accurate calibration of the hemoglobin A1c procedure.

Reagents
The lyophilized hemoglobin A1c calibrators are a hemolysate prepared from packed human erythrocytes. Stabilizers are added to maintain hemoglobin in the reduced state for the accurate calibration of the hemoglobin A1c procedure.

Reagent Preparation
Reconstitute each calibrator vial using 0.5ml of deionized water. Gently mix for 10 minutes, or until all material has dissolved.

Reagent Storage and Stability
1. Store at 2-8°C. Stable until expiration date if sealed tightly. PROTECT FROM LIGHT AND HEAT.
2. The reconstituted calibrator set should be stored refrigerated (2-8°C) and sealed tightly. The calibrator retains its assigned value for at least 30 days at 2-8°C.

Precautions
1. This calibrator set is for in vitro diagnostic use only.
2. Although this product has been tested and found non-reactive for Hepatitis B Surface Antigen (HBsAG) and HIV, no known test can offer assurance that products derived from human blood will not transmit disease. Therefore all human serum products and patient specimens should be handled in the same manner as an infectious agent.
3. Do not pipette by mouth. Avoid contact with skin and mucous membranes.

Materials Provided
Hemoglobin A1c calibrator set with four levels of hemoglobin A1c.

Materials Required But Not Provided
1. Hemoglobin A1c Reagent Set
2. Pipette capable of accurately delivering 0.5 ml.
3. Deionized water

Procedure
The lyophilized hemoglobin A1c calibrator set will produce a calibration curve that will be stable for at least 7 days on most analyzers. The calibrators should be treated in the same manner as patient specimens regarding the hemolysate procedure. Follow the directions that accompany the instrument and reagent kit used in the assay for specific instrument calibration procedures.

Limitations
Things to look for that might cause inaccurate results are improper pipetting, inadequate mixing and poorly calibrated instruments.

Setpoint Values
The setpoint value of the calibrators were obtained by assaying representative samples of the entire lot against materials referenced to NGSP values using the Pointe Scientific Hemoglobin A1c Reagent Set. For Pointe Scientific's Direct Hemoglobin A1c reagent, the following calibrator values should be used:

Lot Number: 202701 Exp. Date: 2014-07
